# INTRODUCING A **WORLD CLASS ARR PROJECT**

**Exceptional design, strong track-record of reforestation success and enhanced biodiversity benefits**

## PROJECT NAME: LOS TITÍES DE SAN JUAN

**WLT partner Fundación Proyecto Tití (FPT) has 30 years of experience protecting and restoring native Tropical Dry Forests in northern Colombia, one of the most threatened ecosystems in the country where less than 7% of the original habitat remains.**

The project lies within the Tumbes-Choco-Magdalena biodiversity hotspot and FPT surveys have confirmed presence of 44 mammal species, 212 birds, 20 amphibians and 47 reptiles.

Proyecto Titi is named after the Cotton Top Tamarin, a tiny but charismatic primate, Critically Endangered and endemic to Northern Colombia.

Cotton Top Tamarins are vulnerable to the devastating loss of habitat as well as persecution for the pet trade. For decades, FPT have been monitoring and protecting cotton tops in the wild, boosting populations and raising awareness of their plight.

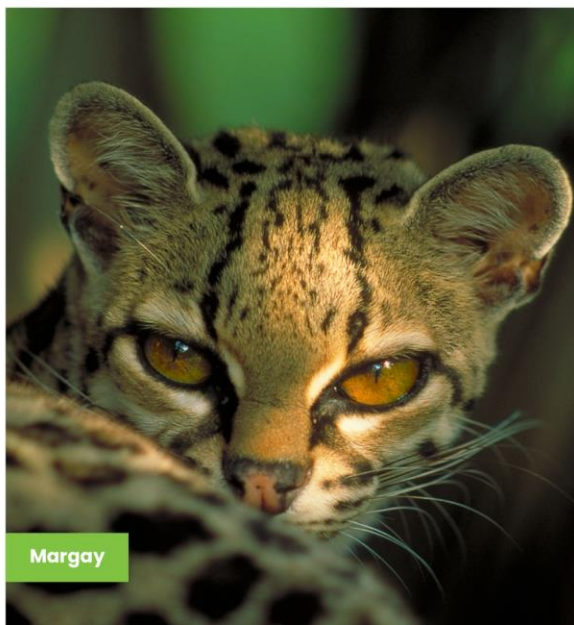

Each year, 1,600 local children learn about titi monkeys and the Tropical Dry Forests.

Margay

Red-footed Tortoise

**The project is certified under the Equitable Earth Standard, its methodology selected for its high integrity project design, conservative estimation of emissions removals, intense and equal emphasis on biodiversity and community alongside carbon.**

From 2025–2028, approximately 300 ha will be planted with more than 180,000 saplings.

The project will issue more than 5,500 removals credits in 2026, vintage 2021–24, and remove an estimated 100,000 tCO<sub>2</sub>e over the 40-year project lifetime.

A world class ARR project - FPT have been trialling reforestation in these unforgiving landscapes for decades. Their expert team have highly developed knowledge and experience restoring this landscape with 80 native tree species, many identified as important for food and shelter for Cotton Top Tamarins.
